FAGSJEF

NORMALER, rettelser og nye**TEMPERATUR**

Rettelser av normaler publisert i DNMI-KLIMA, rapport 02/93 KLIMA, utgave nr. 1

Rettelsene er utevbet. En stasjon som er helt utevbet, er en stasjon som det er beregnet nye normaler for.

Innledning

Dette heftet inneholder temperaturnormaler for Norge basert på normalperioden 1961-1990. Disse normalene er standard normaler til og med år 2020.

I årene frem til og med år 2020 vil det bli beregnet normaler for nye observasjonsstasjoner. Noen normaler som er beregnet på grunnlag av meget korte dataserier vil bli korrigerte.

Normaler for nye stasjoner og korrigerte normaler vil bli tatt inn i fremtidige nye utgaver av normalheftet. For de som har tidligere utgaver vil det samtidig bli laget "normalark" som inneholder nye og korrigerte normaler. De kan legges ved tidligere utgaver.

Introduction

This publication contains temperature normals for Norway based on the normal period 1961-1990. These normals are standard normals up to and including the year 2020.

Normals for new stations will be calculated in the years up to 2020. Some normals that have been calculated from very short data series will be corrected.

Normals for new stations and corrected normals will be included in new editions of the publication. For they who have earlier edition will there at the same time be published "normal sheets". They will contain new and corrected normals.

Temperaturnormaler

Temperature normals

Lufttemperatur

måles 2 meter over bakken.

Manuelle observasjonsstasjoner

benytter kvikksølv- eller sprittertermometre. Termometrene er plassert i en hvitmalt "temperaturhytte" med sjalusivegger. Den gir god gjennomstrømning av luft og skjermer termometrene mot direkte solstråling og mot nedbør.

Temperaturen måles minst tre ganger i døgnet, kl 07, 13 og 19 norsk standard tid (CET). I tillegg måles maksimum- og minimumtemperaturene for hvert døgn.

Automatiske observasjonsstasjoner

måler temperaturene med temperaturfølsomme elektriske motstander. I steden for en "temperaturhytte" som på de manuelle stasjonene, benyttes en annen og mindre beskyttelsesskjerm av plastikk eller metall. Prinsippet er det samme, men temperaturen endrer seg hurtigere

Air temperature

is measured 2 meters above the ground.

Manually observing stations

use mercury- or alcohol thermometers. The thermometers are placed in a white-painted "temperature screen" with louvred walls. The screen gives good ventilation and protects the thermometers against direct sunshine and against precipitation.

Temperatures are measured at least three times a day at 07, 13 and 19 hours Norwegian standard time (CET). Maximum and minimum temperatures are also measured for each day.

Automatic observing stations

measures temperature with temperature sensitive resistances. A smaller plastic or metal screen is used for protection instead of the wooden screens used on the manual stations. The principle is the same, but the temperature changes quicker than in the larger wooden

enn i de større trehyttene. For å få sammenlignbare temperaturer med de fra manuelle observasjonsstasjoner er automatstasjonene programmert til å gi temperaturer som er middelverdier over et minutt.

På automatstasjonene registreres temperaturen av siste minutt i hver time, og maksimum- og minimumtemperaturene i hver time.

Månedstemperatur

beregnes av middelverdiene av observasjonene tatt kl 07, 13, 19 og minimumtemperaturen hver dag vektet med en koeffisient (K-faktor). K-faktorene bestemmes direkte for hver måned for stasjoner som har kontinuerlige temperaturregistreringer og ellers av geografisk posisjon og tid på året. Månedstemperaturen beregnes med følgende formel:

$$T_M = T_{07,13,19} - k(T_{07,13,19} - T_{MIN})$$

hvor

T_M : månedstemperaturen

$T_{07,13,19}$: månedsmiddel av de tre daglige observasjonene kl 07,13,19

k : faktor for å korrigere til 24 timers middel

T_{MIN} : månedsmiddel av daglig minimumtemperatur

screens. The automatic stations are therefore programmed to give temperatures that are mean values over one minute to have temperature readings that are comparable with those from manually operated stations.

Automatic stations register the temperatures of the last minute of each hour and the maximum and minimum temperatures within each hour.

Monthly mean temperature

is computed using the mean values of the observations taken at 07, 13, 19, the minimum temperature each day and using a coefficient (K-factor). The K-factor is calculated directly for stations with continuous temperature registrations and if not of geographical position and time of the year. The monthly mean temperature is calculated using the following formula:

$$T_M = T_{07,13,19} - k(T_{07,13,19} - T_{MIN})$$

where

T_M : monthly mean temperature

$T_{07,13,19}$: monthly mean of the three daily observations at 07, 13, 19

k : factor for correction to 24 hours mean

T_{MIN} : monthly mean of the daily minimum temperature

Månedstemperaturen for automatstasjoner er middelverdien av samtlige temperaturer målt hver hele time i måneden.

Temperaturnormaler

er middelverdier som benyttes for å vise gjennomsnittlige temperaturforhold på en stasjon og for å se hvor mye aktuelle månedstemperaturer avviker fra gjennomsnittlig eller "vanlig" temperatur. Hvis man ser på flere stasjoner er det viktig at middelverdiene refererer til samme tidsperiode. Den meteorologiske verdensorganisasjonen (WMO) har bestemt at periodene 1901-1930, 1931-1960, 1961-1990, osv skal være offisielle referanseperioder eller **normalperioder**. Middelverdiene av månedstemperaturene for 1961-1990 betegnes derfor **normale månedstemperaturer** for å skille dem fra andre middelverdier. Normalene for 1961-1990 vil bli benyttet ut året 2020, da det vil bli beregnet nye normaler med månedstemperaturene for årene 1991-2020 som grunnlag.

For stasjoner som har gått kontinuerlig og uten endringer gjennom hele normalperioden, er temperaturnormalene de aritmetiske midlene for perioden.

The monthly mean value for an automatic station is the mean value of all temperatures measured every whole hour in the month.

Temperature normals

are mean values used to show average temperatures on a station and to see how much actual monthly mean temperatures differ from average or "usual" temperatures. It is important, if one is looking at several stations, that the mean values refer to the same time period. The World Meteorological Organization (WMO) has decided that the periods 1901-1930, 1931-1960, 1961-1990, etc. are official reference periods or **normal periods**. The mean values of the monthly mean temperatures for 1961-1990 are therefore called **normal monthly temperatures** in order to distinguish them from mean values calculated for other time periods. The normals for 1961-1990 will be used to the end of the year 2020 when new normals will be calculated based on the period 1991-2020.

For stations that have operated continuously and have not experienced any changes during the whole normal period,

For stasjoner som bare har vært i drift i en del av normalperioden, beregnes temperaturnormalen ved hjelp av en referansestasjon som har gått hele normalperioden med ligningen

$$T_{XN} = T_{XP} + \frac{(T_{MAX} - T_{MIN})_{XP}}{(T_{MAX} - T_{MIN})_{RP}} (T_{RN} - T_{RP})$$

hvor

T_{XN} : Temperaturnormal for stasjon X som bare har vært i drift i perioden P

T_{XP} : Middelverdi for X i perioden P

$(T_{MAX} - T_{MIN})_{XP}$:
Forskjell mellom høyeste og laveste månedstemperatur for X i perioden P

$(T_{MAX} - T_{MIN})_{RP}$:
Forskjell mellom høyeste og laveste månedstemperatur for referansestasjon R i perioden P

T_{RN} : Temperaturnormal for R

T_{RP} : Middelverdi for R i perioden P

Det er benyttet minimum to referansestasjoner ved beregning av normaler for stasjoner som bare har gått del av normalperioden. De endelige normalene er bestemt ved midling eller ved valg av

are the temperature normals the arithmetic means for the normal period.

For stations that only have been operating during part of the normal period, is temperature normals calculated with help of a reference station that have operated throughout the normal period using the formula

$$T_{XN} = T_{XP} + \frac{(T_{MAX} - T_{MIN})_{XP}}{(T_{MAX} - T_{MIN})_{RP}} (T_{RN} - T_{RP})$$

where

T_{XN} : Temperature normal for station X that has only been operating in period P

T_{XP} : Mean value for X in period P

$(T_{MAX} - T_{MIN})_{XP}$:
Difference between maximum and minimum monthly mean temperature for X in period P

$(T_{MAX} - T_{MIN})_{RP}$:
Difference between maximum and minimum monthly mean temperature for reference station R in period P

T_{RN} : Temperature normal for R

T_{RP} : Mean value for R in period P

Minimum two reference stations have been used for calculating normals for stations that have been operating only part of the normal period. The final normals have been decided by averaging

en av de beregnede. I noen tilfelle er de beregnede verdiene gitt små justeringer. Dette er spesielt tilfelle for stasjoner med meget korte dataserier.

Normalperioder på 30 år er valgt som kompromiss mellom lengde i tid og antall stasjoner som har vært i kontinuerlig og uendret drift gjennom hele perioden. En 30 års periode er vanligvis lang nok til at enkelte ekstreme verdier ikke får avgjørende virkning på normalene. Men i Norge som i de fleste andre land, er de naturlige variasjonene i klimaet så store at det vanligvis blir mindre forskjeller mellom normalene fra en periode til den neste.

De fleste nye temperaturnormalene for 1961-1990 er litt lavere enn de tilsvarende for 1931-1960. Forskjellene er imidlertid så små at de bare gir uttrykk for naturlige variasjoner og ikke for noen varige endringer i temperaturklimaet.

For studier av klimaendringer og en rekke klimarelaterete anvendte spørsmål må man benytte lengre datarekker som går over mer enn en normalperiode.

or by choosing one of the calculated ones. In some cases have the calculated values been given small adjustments. This is specially the case for stations with very short data series.

Normal periods of 30 years are chosen as a compromise between length of time and number of stations that have operated continuously and unchanged through the whole period. A 30 year period is usually long enough to avoid that extreme events have decisive effects on the normals. But in Norway, as in most countries, are the natural climate variations so large that there usually are minor differences between normals from one period to the other.

Most of the new temperature normals for 1961-1990 are a little lower than the corresponding ones from 1931-60. The differences are, however, so small that they only express natural variations and not a permanent change in the temperature climate.

For studies of climate change and climate information for several applied purposes, is it necessary to use data series that covers more than one normal period.

Tabell 1.**Temperaturnormaler**

Tabell 1 gir normaler for lufttemperatur beregnet av data for normalperioden 1961-1990.

Stasjonene er sortert etter Klimaavdelingens stasjonsnummersystem som starter i Trysilvassdraget og slutter i Grense Jakobselv. Stasjonsnumrene starter nederst og øker oppover i vassdragene. Stasjonene i Arktis kommer til slutt.

DNMI får ofte spørsmål om temperaturnormaler for steder der det ikke er observasjonsstasjoner. Vi har derfor beregnet normaler for byer og en del tettsteder uten observasjoner. De er plassert i tabellen som om de hadde stasjonsnumre, men i steden står bare Kolonnen for periode står også tom.

Tegn i periode-kolonnen betyr:

- * : brudd i observasjonsrekke
- " : hundreår er 19 (34" betyr 1934)
- A : automatstasjon eller endret fra manuell til automatisk i løpet av normalperioden

Table 1**Temperature normals**

Table 1 gives normals for air temperature calculated from data for the normal period 1961 - 1990.

The stations are arranged after the Climatological Divisions station number system, which starts in the Trysil watercourse and ends in Grense Jakobselv. The station numbers increase upstream each watercourse. The Arctic stations end the table.

DNMI is often asked about temperature normals for places where we do not have stations. We have therefore calculated normals for towns and some places without observations. They are placed in the table as if they have station numbers, but they are instead marked with The period column is empty.

Symbols in the period column:

- * : not continuous data serie
- " : century is 19 (34" means 1934)
- A : automatic station or changed from manual to automatic during the normal period

Tabell 2**Fylkesvis alfabetisk liste**

I denne tabellen er temperaturnormalene ordnet fylkesvis. Stasjonene er arrangert i alfabetisk orden innen hvert fylke.

Rekkefølgen på fylkene følger den offisielle nummerorden.

Det vises ellers til forklaringen foran tabell 1.

Table 2**Countywise alphabetical table**

The temperature normals are arranged after county. The stations within each county are given in alphabetical order.

The order of the counties is in accordance with the official numbering.

For other information, see explanation before table 1.

Fylkesvis alfabetisk liste

Tabell 3**Høyeste og laveste temperaturnormaler**

Tabellen inneholder for hver måned de tre stasjonene med henholdsvis høyeste og laveste temperaturnormaler. Alle stasjoner med samme temperaturnormal er tatt med, slik at for noen måneder er det tatt med mer enn tre stasjoner.

For månedene januar, februar, desember og for året er også den kaldeste stasjonen i Sør-Norge tatt med.

Tabellen inneholder bare stasjoner under 1000 meter o.h.. Stasjonene i Arktis er ikke med i tabellen.

Table 3**Highest and lowest temperature normals**

The table contains for each month the three stations with respectively the highest and lowest temperature normals. All stations with same temperature normal are shown, and some months have therefore more than three stations.

In addition is the coldest station in southern Norway shown for January, February, December and for the year.

The table contains only stations below 1000 meters a.s.l., and it does not include stations in the Arctic.

Tabell 4**Normale døgn temperaturer**

Normale døgn temperaturer (døgmidler) er beregnet for alle stasjoner i tabell 1.

I denne tabellen er vist normale døgn temperaturer for 8 stasjoner. De som er interessert i tilsvarende tabeller for andre stasjoner, kan henvende seg til DNMI - Klimaavdelingen.

Table 4**Normal daily temperatures**

Normal daily temperatures (daily means) have been calculated for all stations in table 1.

Normal daily temperatures for 8 stations are shown in the table. They who are interested in equivalent tables for other stations, may contact DNMI - Climatological Division.

ÅRSNORMAL: -6.0

STANDARDAVVIK ÅRSNORMAL: 7.8

Standardavvik for månedsnormal er beregnet av alle døgnnormalene i måneden.

Standardavvik for årsnormal er beregnet av alle døgnnormalene i året.

Figur 1

Avvik fra middelverdi

De fleste månedstemperaturene avviker fra de tilhørende månedsnormalene. Fordelingen av avvikene varierer fra måned til måned. Vinteravvikene er skjevfordelte, mens sommeravvikene er mer normalfordelte.

Figuren viser fordelingen av månedstemperaturenes avvik fra middelverdiene for hele observasjonsperioden for fire stasjoner:

1870 Oslo - Blindern 1838 - 1992
5056 Bergen - Fredriksberg 1835 - 1992
6817 Trondheim - Tyholt . . 1761 - 1992
9045 Tromsø 1868 - 1992
For deler av datarekken er det satt inn justerte data fra andre stasjoner.

Diagrammene i figuren gir langs den horisontale skalaen avvik i 0.5° . Den vertikale skalaen til venstre gir summen av hver 0.5° -kolonne i prosent av antall data, og den til høyre gir den kumulative fordelingen (kurve).

Figure 1

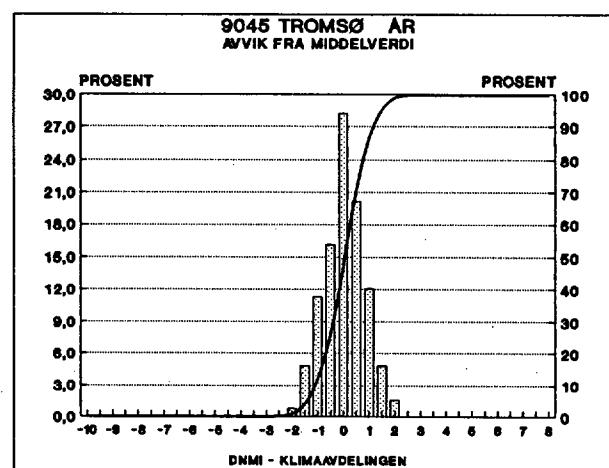

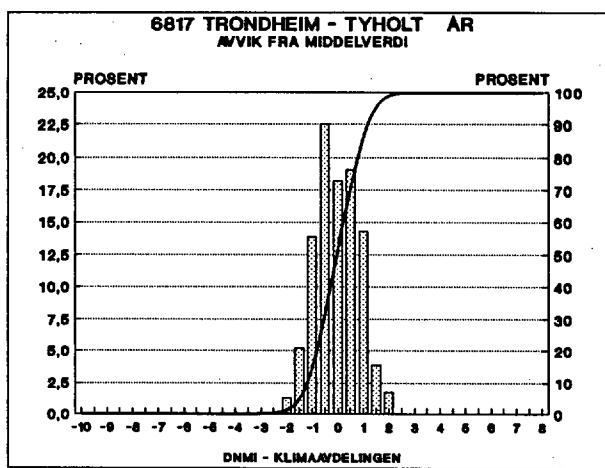

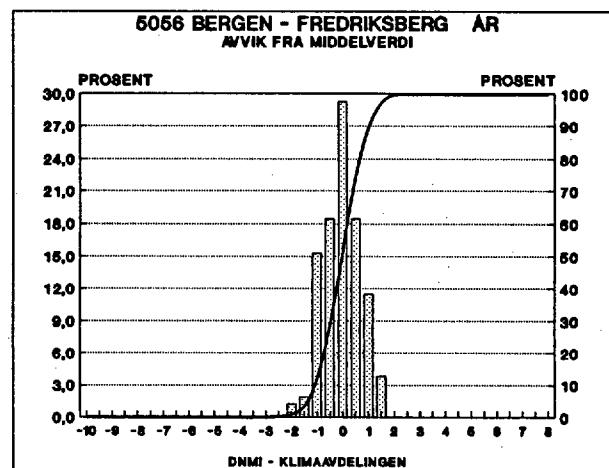

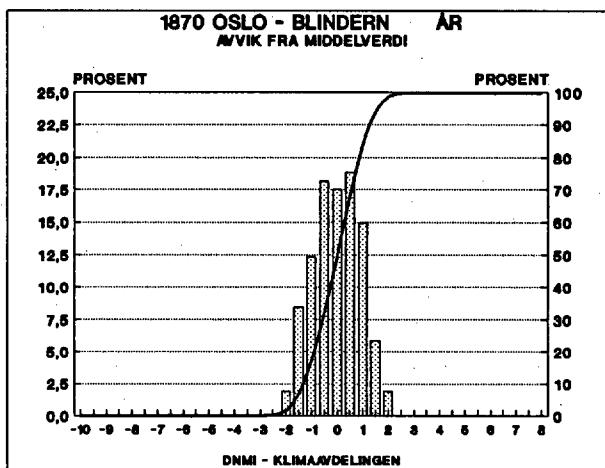

Deviations from average

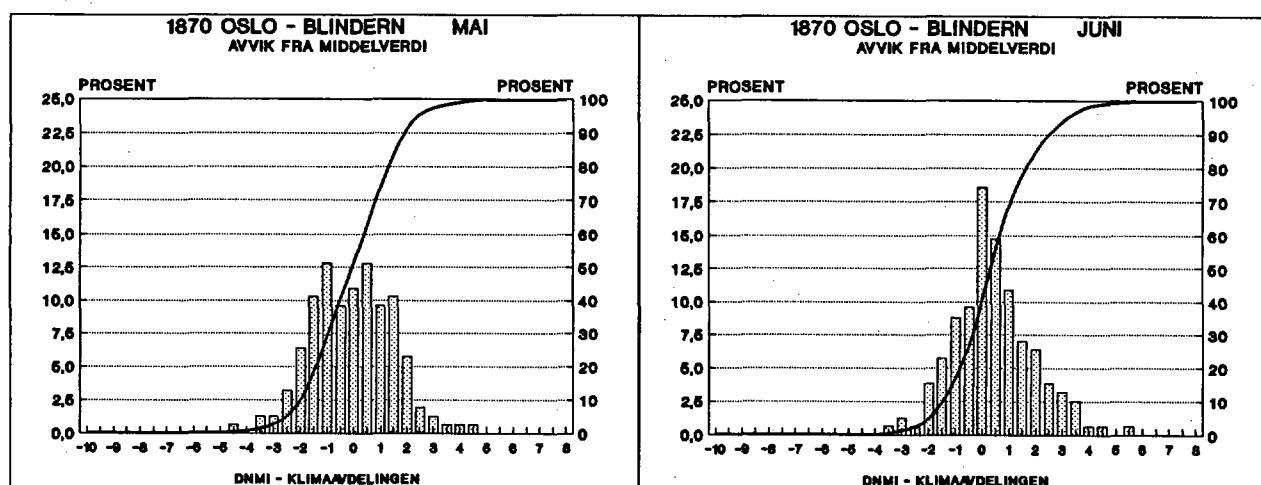

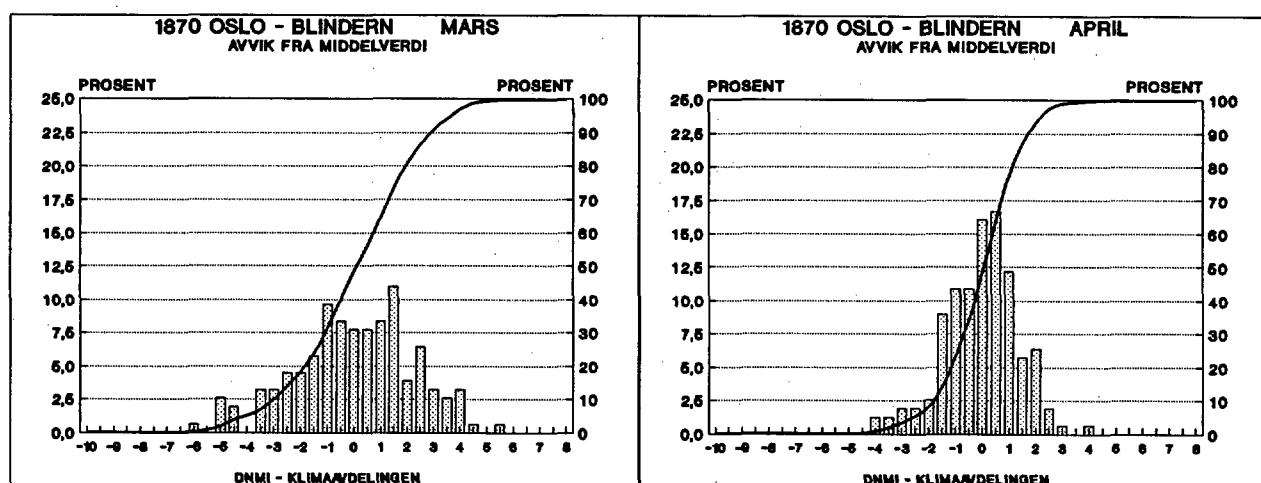

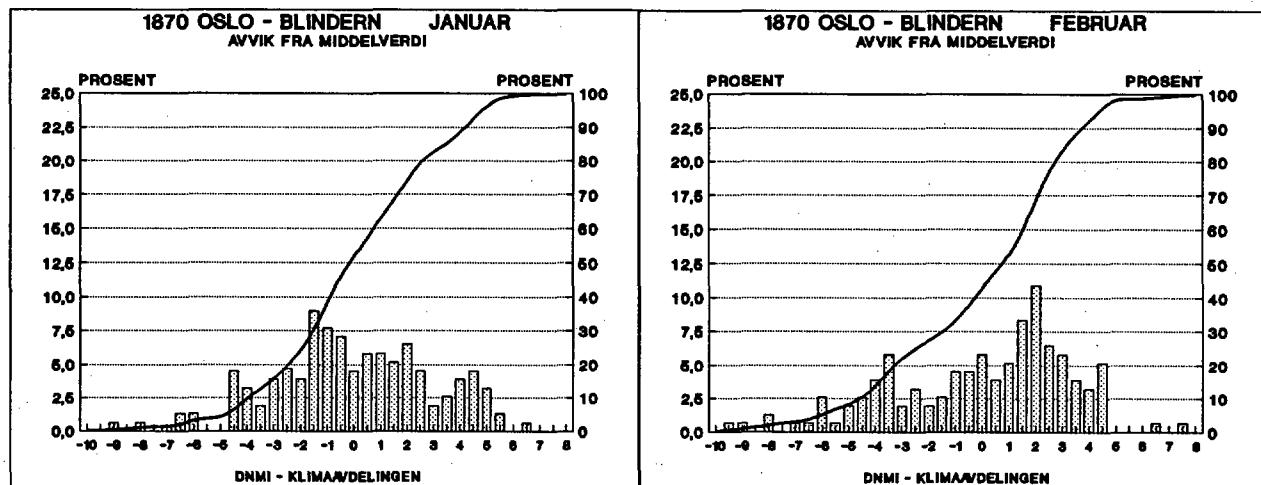

Most monthly mean temperatures deviate from their respective monthly temperature normals. The distribution of the deviations varies from month to month. The winter deviations have a skew distribution, while the summer deviations have a more normal distribution.

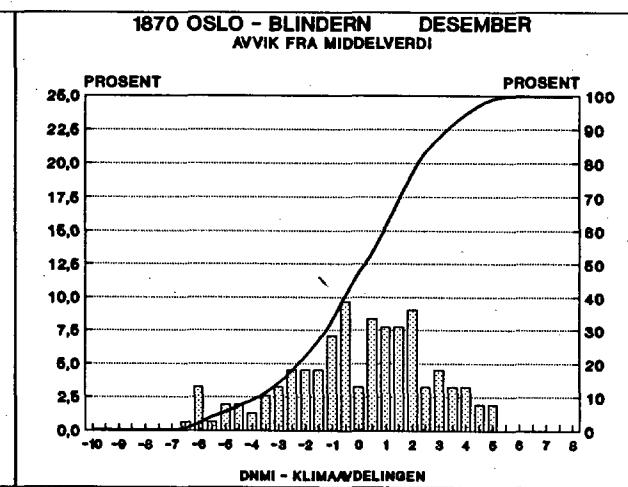

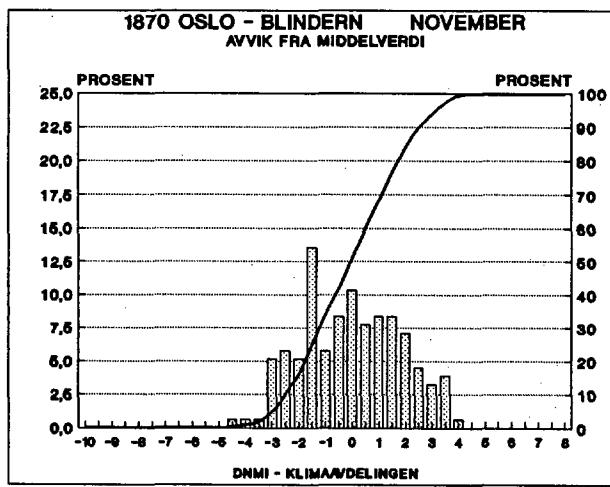

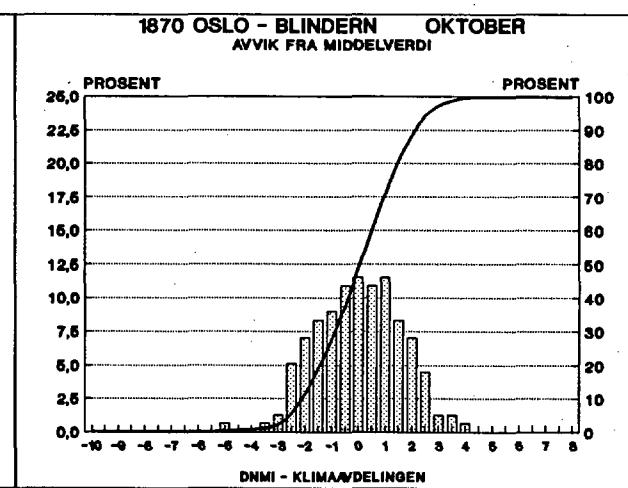

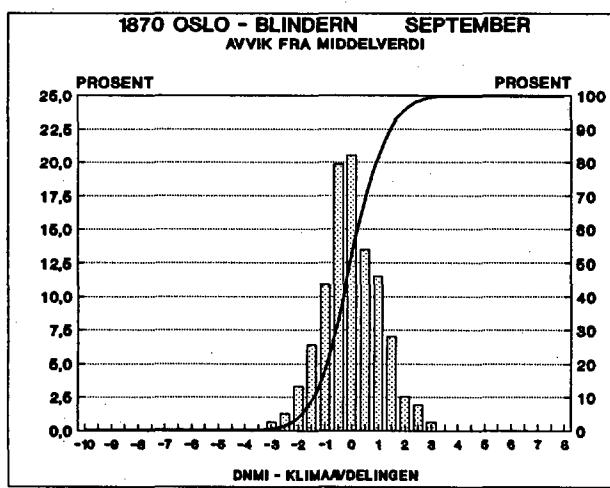

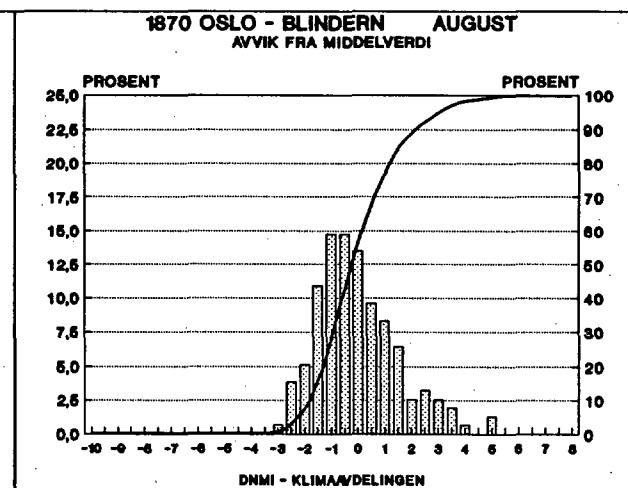

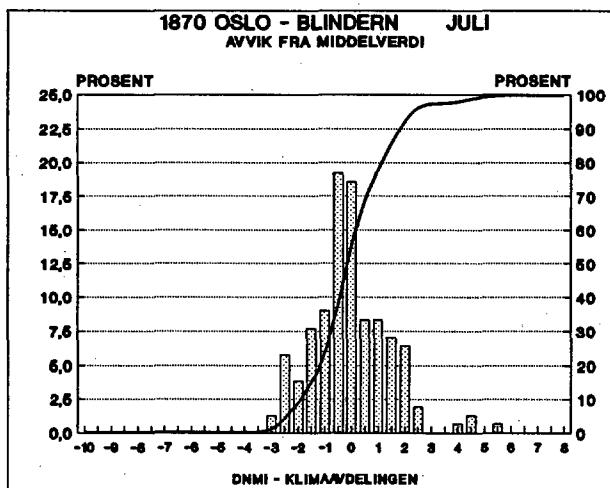

The figure shows the distributions of the temperature deviations from the averages for the whole observational period for four stations:

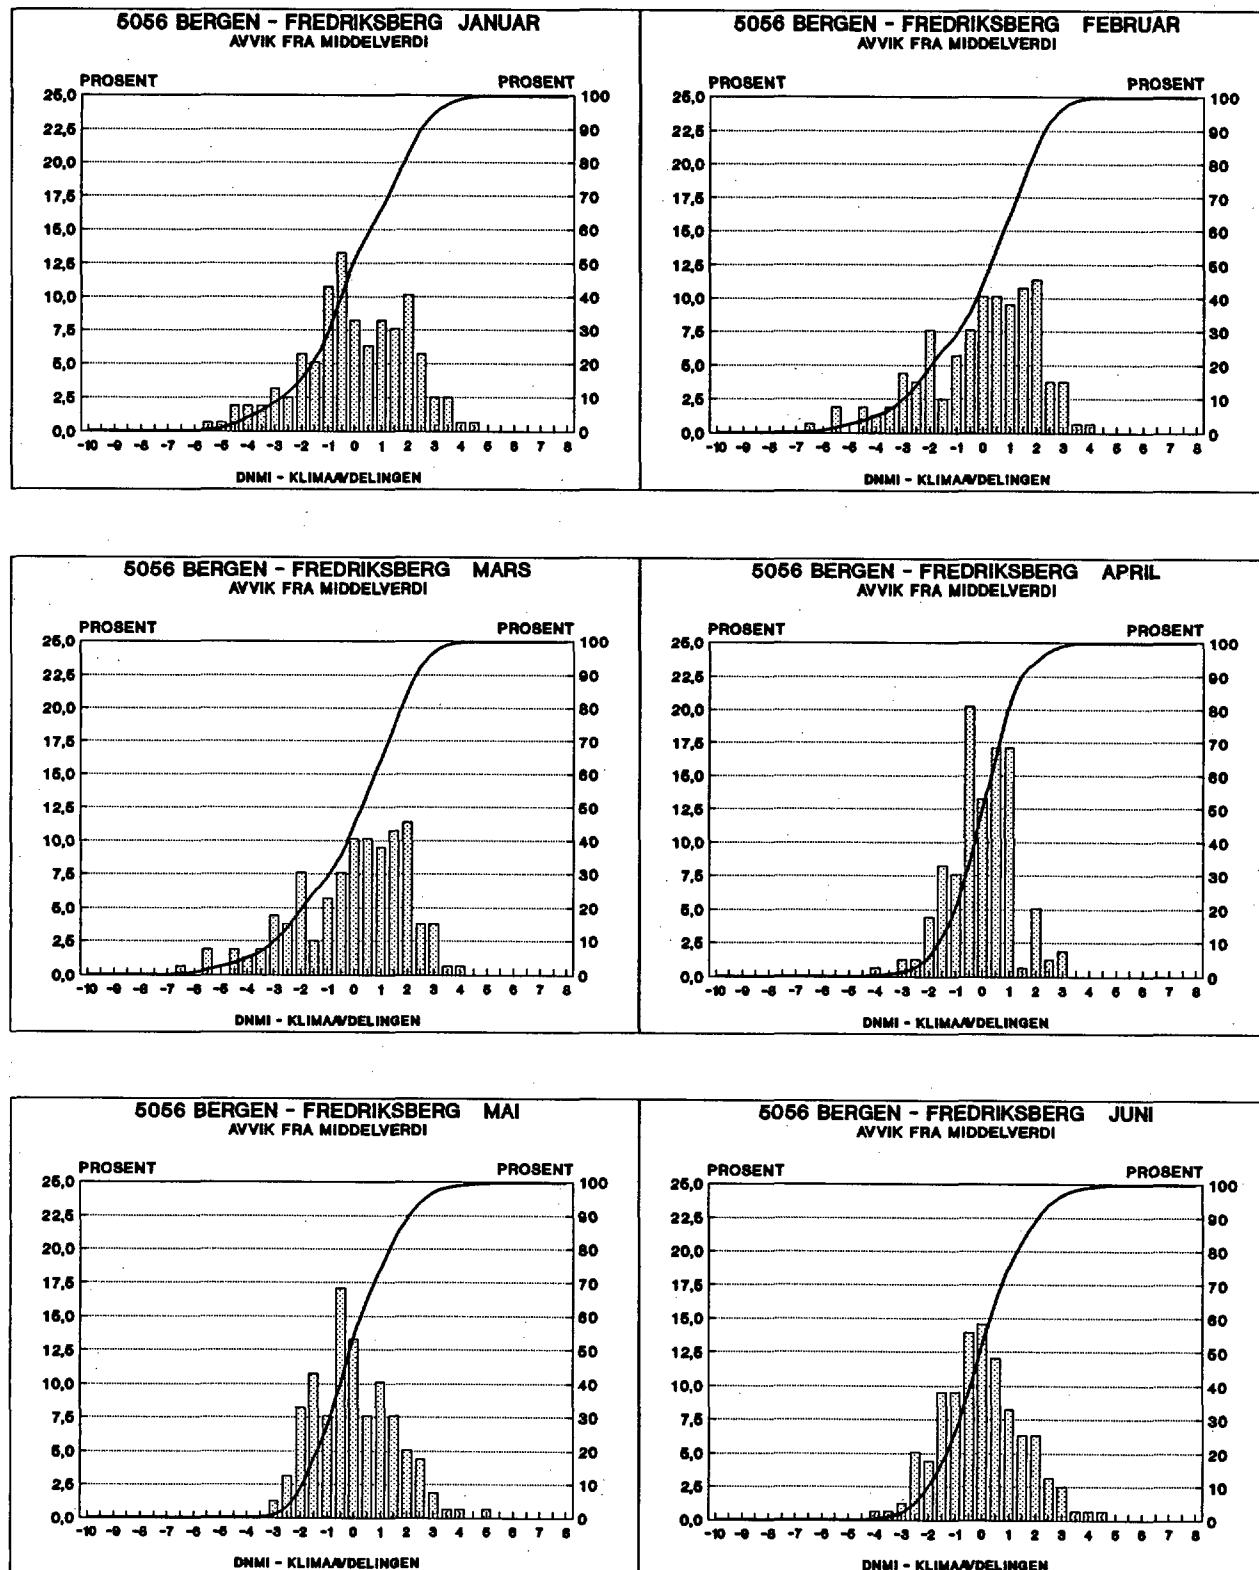

1870 Oslo - Blindern 1838 - 1992
5056 Bergen - Fredriksberg 1835 - 1992
6817 Trondheim - Tyholt . . 1761 - 1992
9045 Tromsø 1868 - 1992
Parts of the data series consist of adjusted data from other stations.

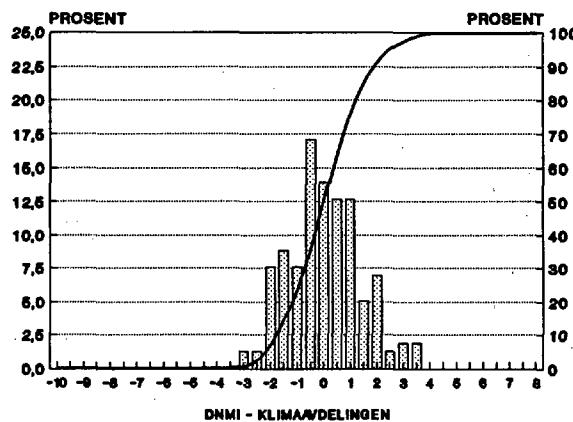

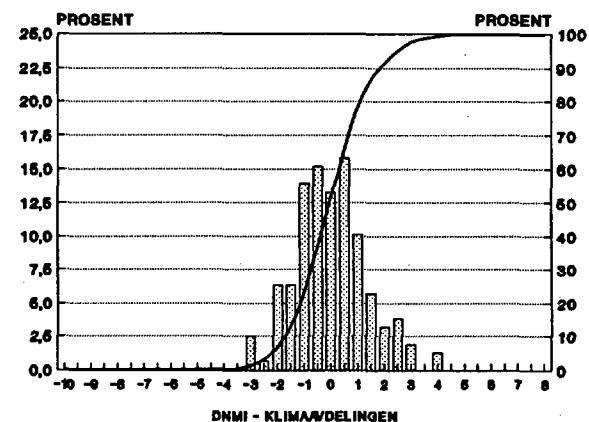

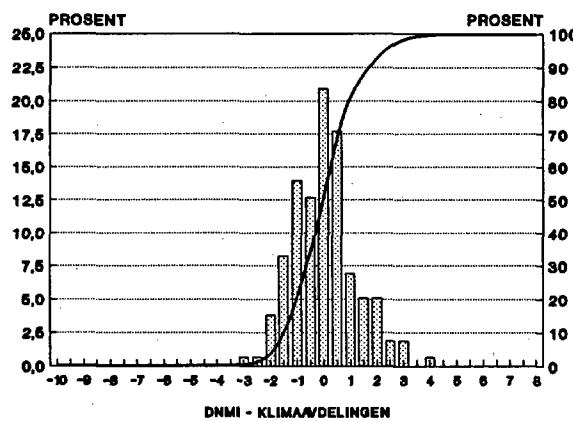

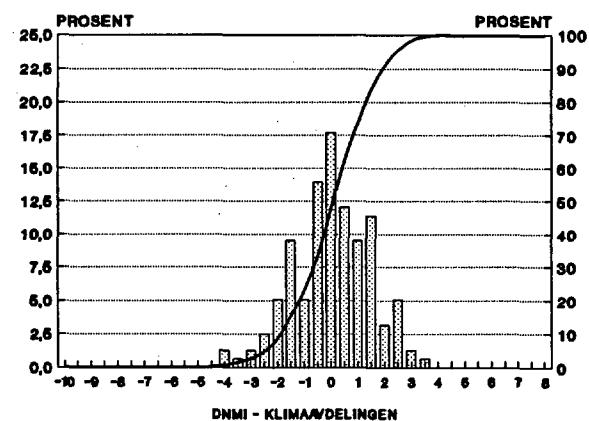

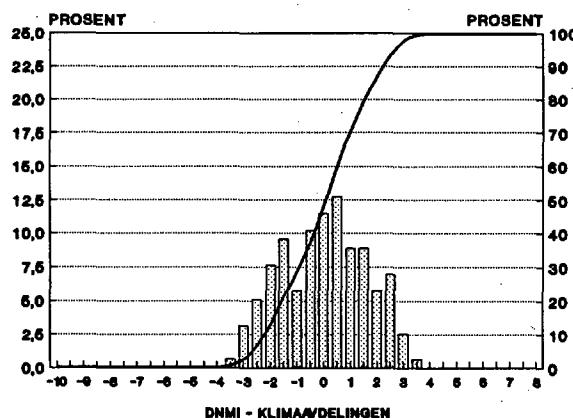

The horizontal scale in the diagrams give the deviation in 0.5° . The vertical scale to the left gives the total of each 0.5° -column in percent of total number of data and the one to the right gives the cumulative distribution (curve).
