TITLE

Environmental data Gullfaks C. Annual synthesis/analysis 1996.

AUTHOR

Knut A. Iden and Helle Tønnesen

PROJECT CONTRACTOR

STATOIL A/S , Contract No.ANS026469

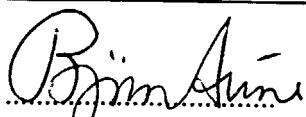

SUMMARY

The history of the environmental data system at Gullfaks C is presented very shortly. The system of to day is described with regard to the main environmental parameters. The performance in 1996 is described. The measurements of the main environmental parameters in 1996 are summarised. Frequency tables for wind speed /wind direction and significant wave height (Hs)/wave period(Tz) are computed. Probability values for different return periods are computed for wind speed and significant wave height based on the combined data series from Statfjord A and Gullfaks C.

1. Introduction

This report is a summary of the environmental conditions recorded at the Gullfaks C platform during 1996. The data has been recorded by Statoil a/s , the operator of the Gullfaks field.

Oceanographic and meteorological data has been measured since November 1989 at Gullfaks C giving information of the environmental conditions the platform are influenced by. The regularity of the recording system was variable in the beginning. The data reported from the platform were in periods actually measured at platform Statfjord A. The storing system for the instrumental data was operational in November 1990 but December 1990 is the first one with data coverage near 100 %. Until December 1992 the EMS system archived hourly values and data was transferred to DNMI in the data format DF005. In December 1992 the format was changed to DF015 and later to DF022. From December 1992 values are recorded each 20 minute.

The collection of environmental data related to the oil activity is specified in the "Acts, regulations and provisions for the petroleum activities" issued by the Norwegian Petroleum Directorate.

The environmental data are collected in order to :

- Judge the safety of the installations
- Determine the long-term effects of the environment on the structures
- Improve construction requirements
- Help to plan field operations.

Three hourly weather reports are produced routinely and submitted to DNMI in the form of a coded message (SYNOP/SHIP message). The SHIP messages are important for the weather

forecasting system. The three hourly weather reports are also stored at DNMI in the general archive serving Climatological purposes.

At Gullfaks C the complete set of parameters available in the EMS are stored each 20 minute. Each month these data are retrieved from the system and copied to a streamer tape. The streamer tape is sent to MIROS a/s where the data are checked. Quality controlled data are on a monthly basis sent to DNMI together with a report. The parameters available in the complete DF022 format is given in Appendix A.

The data controlled by MIROS a/s are the basis for this annual synthesis report. It is an established practice that the first permanent platform in a new area is instrumented to record the environmental conditions. In the Statfjord/Gullfaks region this responsibility was first given to the platform Statfjord A. From this site measurements started in 1978. The reporting of environmental data from the area was transferred to the platform Gullfaks C in November 1989. Gullfaks C was from this time established as an operational centre for the helicopter traffic in the area.

2. The data collecting system (GFC-EMS)

2.1 Instrumentation

The EMS is delivered by MIROS A/S and all parameters regarding waves are measured by a MIROS wave radar. The meteorological parameters are measured by instruments from other firms. The different instruments are interfaced to the EMS with an exception for the sea temperature. This parameter is measured by personnel on board the stand by vessel each 3 hour and reported to the platform.

The main environmental parameters are measured with the following sensors :

WIND SENSORS

Manufacturer	Vaisala
Type	Wind speed and wind direction sensors
Model	WAA 15 and WAW 15
Range	0-75 m/s 0-360 °
Location B	Top of derrick 142.5 m above mean sea l. (SHIP message)
Location A	Top of antenna tower 99 m above mean sea l. (METAR)

AIR TEMPERATURE SENSOR

Manufacturer	Vaisala
Type	Platinum Resistance Element
Model	DTS 12
Range	-100 - +100 °C
Location	Top of the module LQ-L13 73 m above mean sea l.

AIR HUMIDITY SENSOR

Manufacturer	Vaisala
Type	Humicap
Model	HMP 30U
Range	0 - 100 % RH
Location	Top of the module LQ-L13 73 m above mean sea l.

AIR PRESSURE SENSOR

Manufacturer	Vaisala
Type	Vaisala aneroid
Model	PA 21
Range	500 - 1060 hPa
Location	77.5 m above mean sea l.

WAVE SENSOR

Manufacturer	MIROS a/s	
Type	MIROS Wave Radar	
Model	SH-001/03, CP-6506 (From 18.12.96 MIROS Mk.2 type no. SM-001)	
Location	SW corner of the platform 69 m above mean sea l.	
Range	Max. wave height	0-40 m
	Signif. wave height	0-20 m
	Period, mean and peak	3-30 s
	Direction, mean	0-360 °
	Direction, spread	15-90 °

2.2 Performance and data coverage

Personell from DNMI visited Gullfaks C 10-11 September on behalf of The Norwegian Petroleum Directorate (NPD). They found all sensors performing well inside the conditions prescribed by the NPD regulations.

The data coverage in 1996 for the main parameters are given in table 2.1. As mentioned above, the sea temperature (Tw) is measured by the personnel of the stand by vessel and reported from Gullfaks C to DNMI on a 3 hourly basis in the SYNOP-SHIP message. The data coverage is near 100 % throughout the year for this parameter. All the other parameters are logged in the GFC-EMS system each 20 minute. The data coverage for these parameters vary through the year. The wind parameters have a coverage near 100 % while the wave parameters have a more varying coverage. In December wave data is missing for the period 3-17 due to a replacement of the wave radar with a new type.

3. Special weather events in 1996

In the period 1980-1994 there are about 12 events recorded in the Statfjord/Gullfaks area where the significant wave height was 10 m or higher. The criterion "significant wave height ≥ 10 m" has been applied to determine weather events of some interest. In 1995 there were 6 different situations where the criterion is fulfilled. This is the highest number of events of this kind for a single year in the record.

In 1996 there are only one weather event with significant wave heights above 10 m. On this occasion the significant wave height was above 9m from 11 March 1840 GMT until 12 March 1940 GMT. Most of the time the values stayed above 10 m with 11.9 m as a maximum for Hm0 1100 GMT on the 12. Estimate for Hmax was 18.5 m at the same time. Weather maps valid for 12 UTC 11 and 12 March are presented in Figure 3.1 and 3.2. The weather situation is dominated by a depression North-west of Iceland and a high pressure system with centre over the Northern part of Finland. This results in strong southerly wind in the Statfjord and other parts of the North Sea.. The direction is very stable from South during this period. Conditions for wave growth is therefore favourable. Wind speed is given in Figure 3.3 and Hmo an Hmax are given in fig 3.4.

On 17 of February another weather event occurred worth mentioning. At this time swell with period of approximately 22 seconds propagated into the Northern part of the North Sea from a storm area in the Atlantic Ocean. The weather situation and wave conditions are documented in a report by Rasmus Myklebust (VPV01/96)

4. Results

4.1 Climatological summary Gullfaks C 1996

A short summary of the main parameters measured at Gullfaks C is presented in table 4.1. The parameters presented are listed below.

- T = Air temperature measured 73 m a.m.s.level
- Tw = Sea temperature measured by the stand by vessel
- U = Air humidity in %
- QFF = Air pressure measured 77,5 m above m.s.l. reduced to m.s.l.
- Hm0 = Estimate of significant wave height
- Hmax = Estimate of maximum wave height
- FF = Wind speed (10 min mean) measured in top of derrick (142 m) and reduced to reference level 10 m a.m.s.level
- FX = Maximum wind speed (10 min mean) ...
- FG = Gust wind speed (3 sec mean) measured in top of derrick (142 m) and reduced to reference level 10 m a.m.s.l

The reduction coefficient applied both for FF, FX and FG in the GFC-EMS is : $x=(10/142)^{**}0.13=.708$

The reduction coefficient for the gust wind speed (FG) taken equal to the reduction to the 10 min mean wind speed (FF) is not correct. In most cases this will give a too high reduction. The reason that this is not changed is not to introduce inhomogeneities in the archive. It is easy to reconstruct the measured value in the derrick 142 m a.m.s.l. and give it a more correct treatment when needed.

The parameters are stored each 20 minute in the existing system at Gullfaks C. The 10 min mean wind speed (FF) represents the last 10 min of the 20 min period. The maximum of the 10 min mean may have occurred in the period not presented. The maximum 10 min mean of the wind speed (FX) is recorded independently and updated each 3 hour. As can be seen of the table the maximum of FX is thus \geq the maximum of FF.

Table 4.1 Summary of the main parameters measured at Gullfaks C in 1996.

4.2 Frequency tables wind speed/wind direction

Environmental data has been measured in the Gullfaks area since 1978. From 1978 until November 1989 the measurements were performed at the platform Statfjord A. The logging of environmental data was operational from 1981. For the period 1978-1980 3 hourly data is available. Below we have based the computations on the combined series from Statfjord A and Gullfaks C covering the period 1981-1996. In doing so hourly values of the parameters have been extracted from the period covered by Gullfaks C.

The reason for this is the change in storing frequency from December 1992. Until November 1992 only hourly values are available both from Statfjord A and Gullfaks C. From December 1992 measurements exist each 20 minute. Without reduction to hourly values the period after December 1992 would have been given too much weight.

The data coverage varies through the period analysed. The year to year variations are presented in figure 4.1. It is seen that data coverage are low in 1988, 1990 and 1992. Statistical parameters of the frequency distribution are given in figure 4.2.

4.3 Frequency tables wave height/wave period (Hs/Tz)

Environmental data has been measured in the Gullfaks area since 1978. From 1978 until November 1989 the measurements were performed at the platform Statfjord A. The logging of environmental data was operational from 1981. For the period 1978-1980 3 hourly data is available. Below we have based the computations on the combined series from Statfjord A and Gullfaks C covering the period 1981-1996. In doing so hourly values of the parameters have been extracted from the period covered by Gullfaks C.

The reason for this is the change in storing frequency from December 1992. Until November 1992 only hourly values are available both from Statfjord A and Gullfaks C. From December 1992 measurements exist each 20 minute. Without reduction to hourly values the period after December 1992 would have been given too much weight.

The data coverage of the wave measurements are varying. In the end of the period covered by Statfjord A (1988-1990) one of the tape units of the data acquiring system was out of order most of the time. This resulted in a data coverage near 0 % for wave height for these years. The data coverage on a yearly basis is shown in figure 4.3 as the number of observations.

Statistical parameters based on the yearly frequency distributions of significant wave height are given in figure 4.4. The parameters are not defined for the years 1989 and 1990. The values for 1988 are also questionable.

In the frequency tables there are very low values of Tz (2 seconds and below). Time series of Tz for the two buoys located at Statfjord A has been plotted (not presented here). Tz from buoy A are mostly above Tz from buoy B with exceptions for periods in July 1983, September 1985 and December 1986 where Tz from buoy A seem to be erroneous and giving low values. It is the data from buoy A which is used together with the data from Gullfaks C and the mentioned periods are responsible for most of the low Tz values occurring in the frequency tables. These low Tz values should be neglected.

STATFJORD A /GULLFAKS C

Number of measurements of wave height

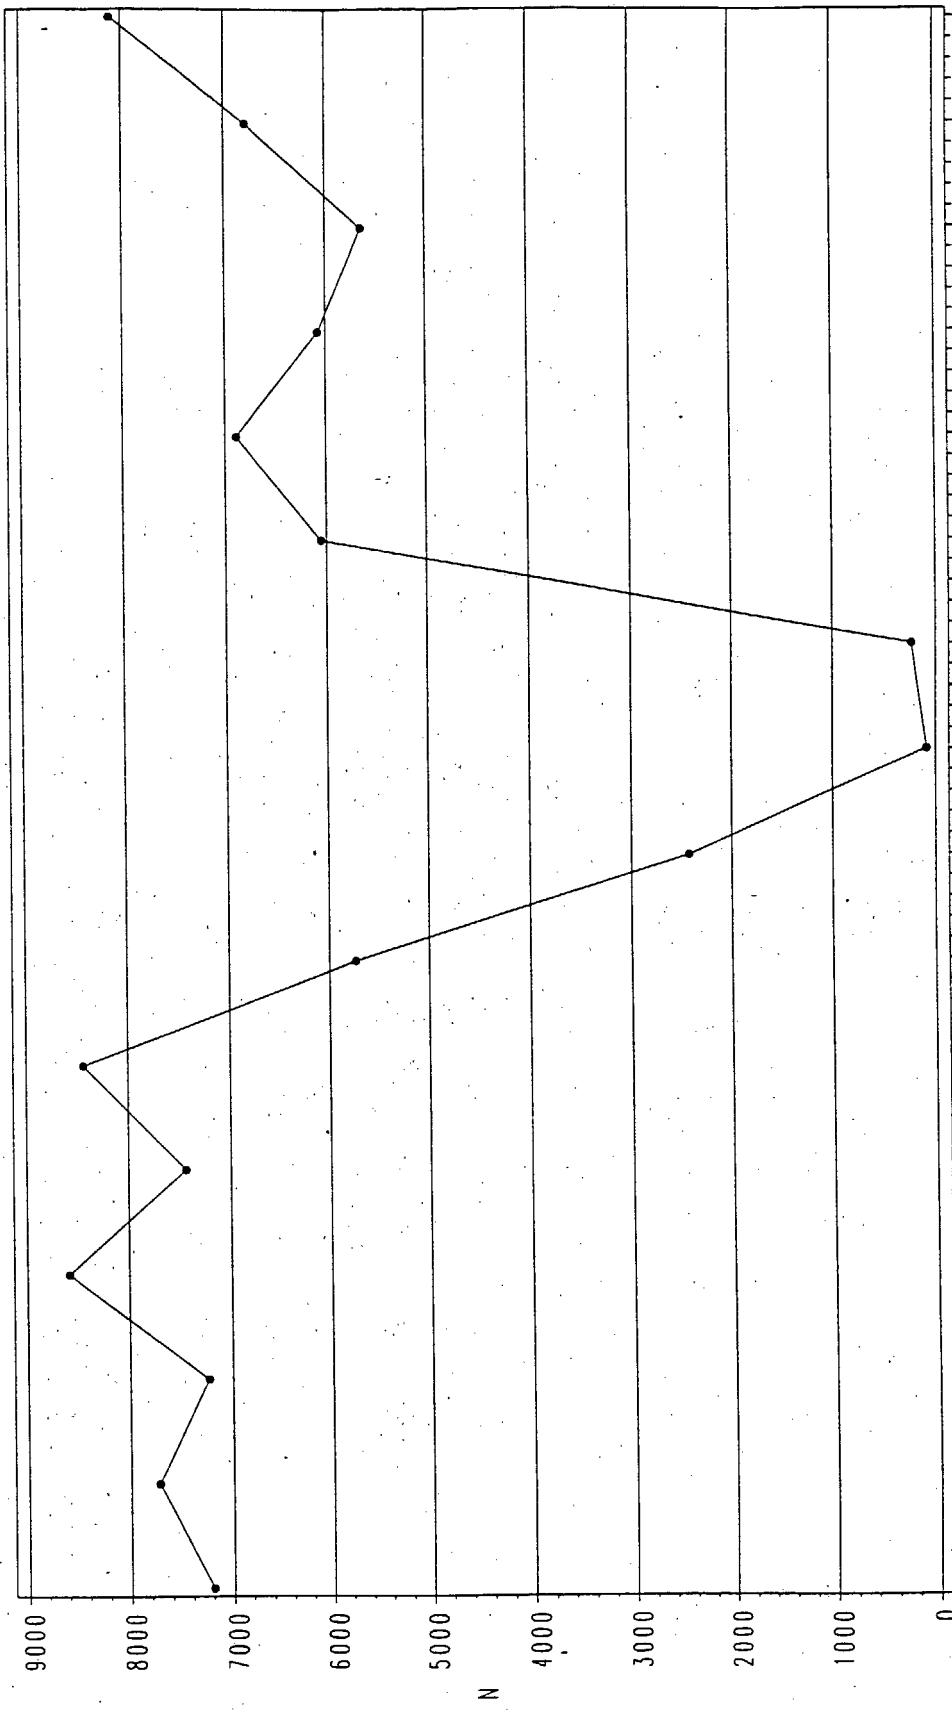

Figure 4.3 Data coverage for significant wave height given as number of observations each year. 8760/8784 observations/year represents 100 % coverage.

STAFFJORD A /GULLFAKS C

Statistical parameters based on significant wave height

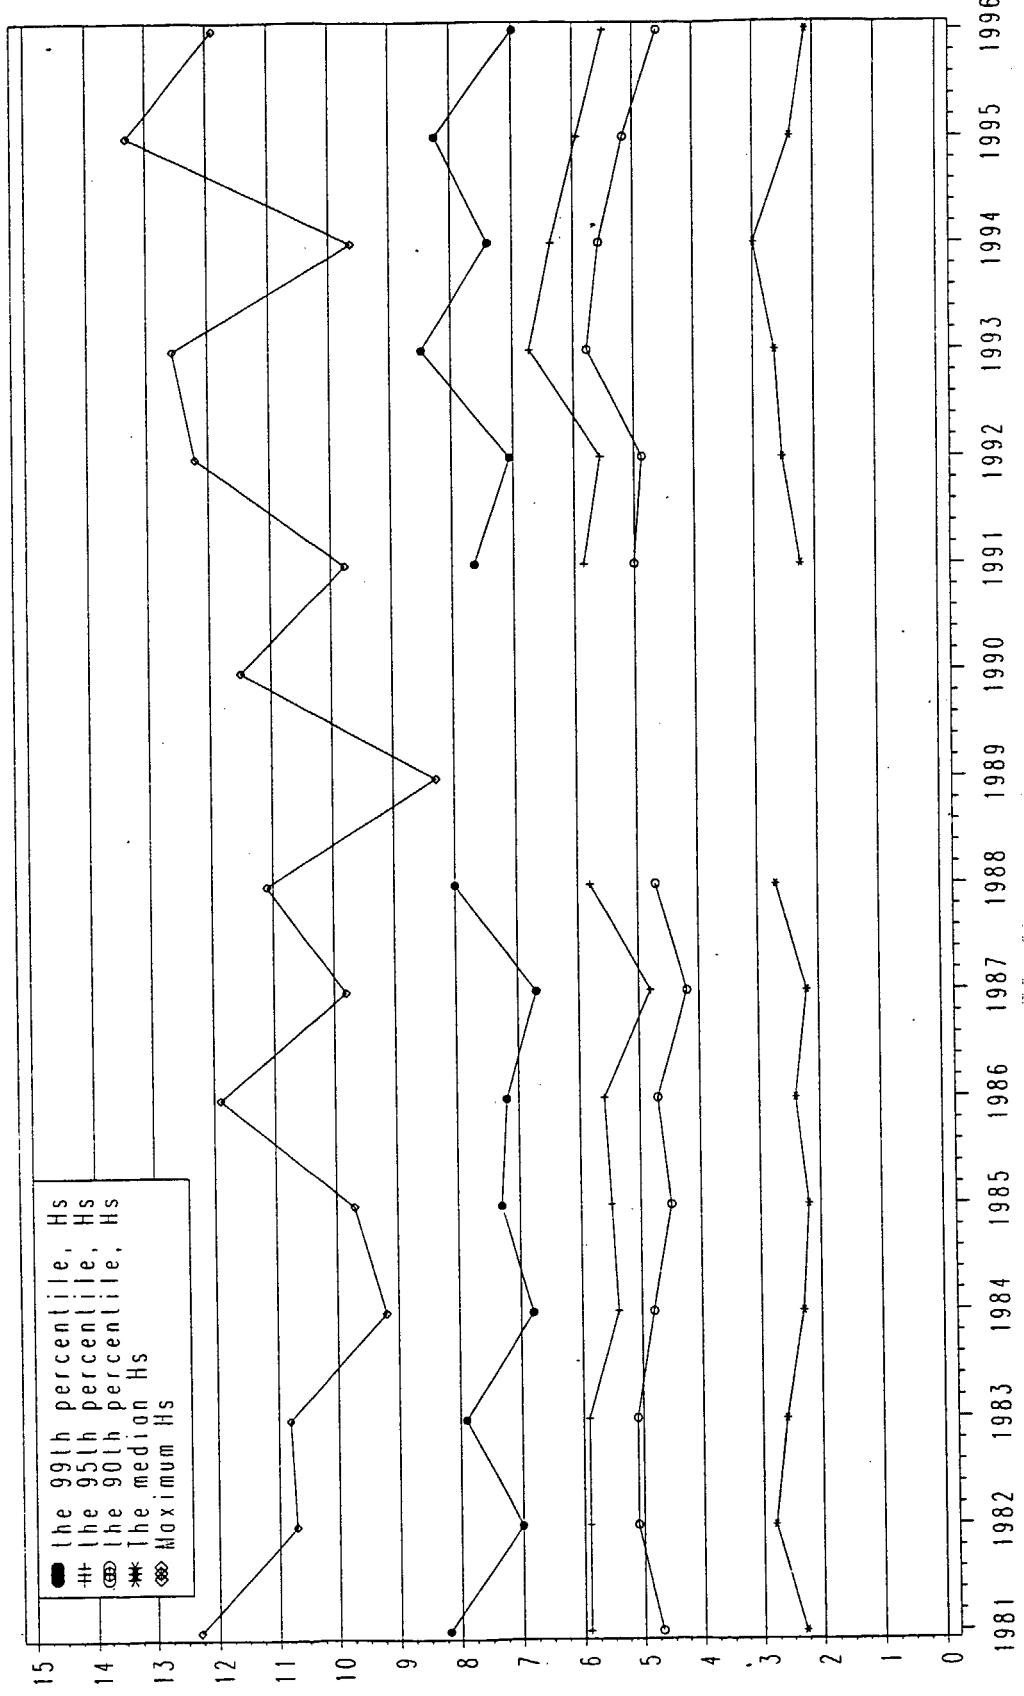

Figure 4.4 Statistical parameters based on the yearly frequency distribution of significant wave heights (Staffjord A/Gullfaks C).

5. Computation of 10-100 year estimates

5.1 10-100 year estimates of the wind speed based on the 10 m level

MODEL DISTRIBUTION:

WEIBULL parameters:
 Shape 1.965
 Scale 9.747
 Location -0.156

Estimated using:
 Method of Moments

ESTIMATED EXTREMES:

"RETURN" PERIOD	VALUE
- years -	- m/s -
1.0	27.9
5.0	30.6
25.	33.2
100.	35.2

Duration of exceedance:
 3.0 hours

OBSERVED DISTRIBUTION:

Mean value 8.48
 Std. deviation 4.59
 Skewness 0.66

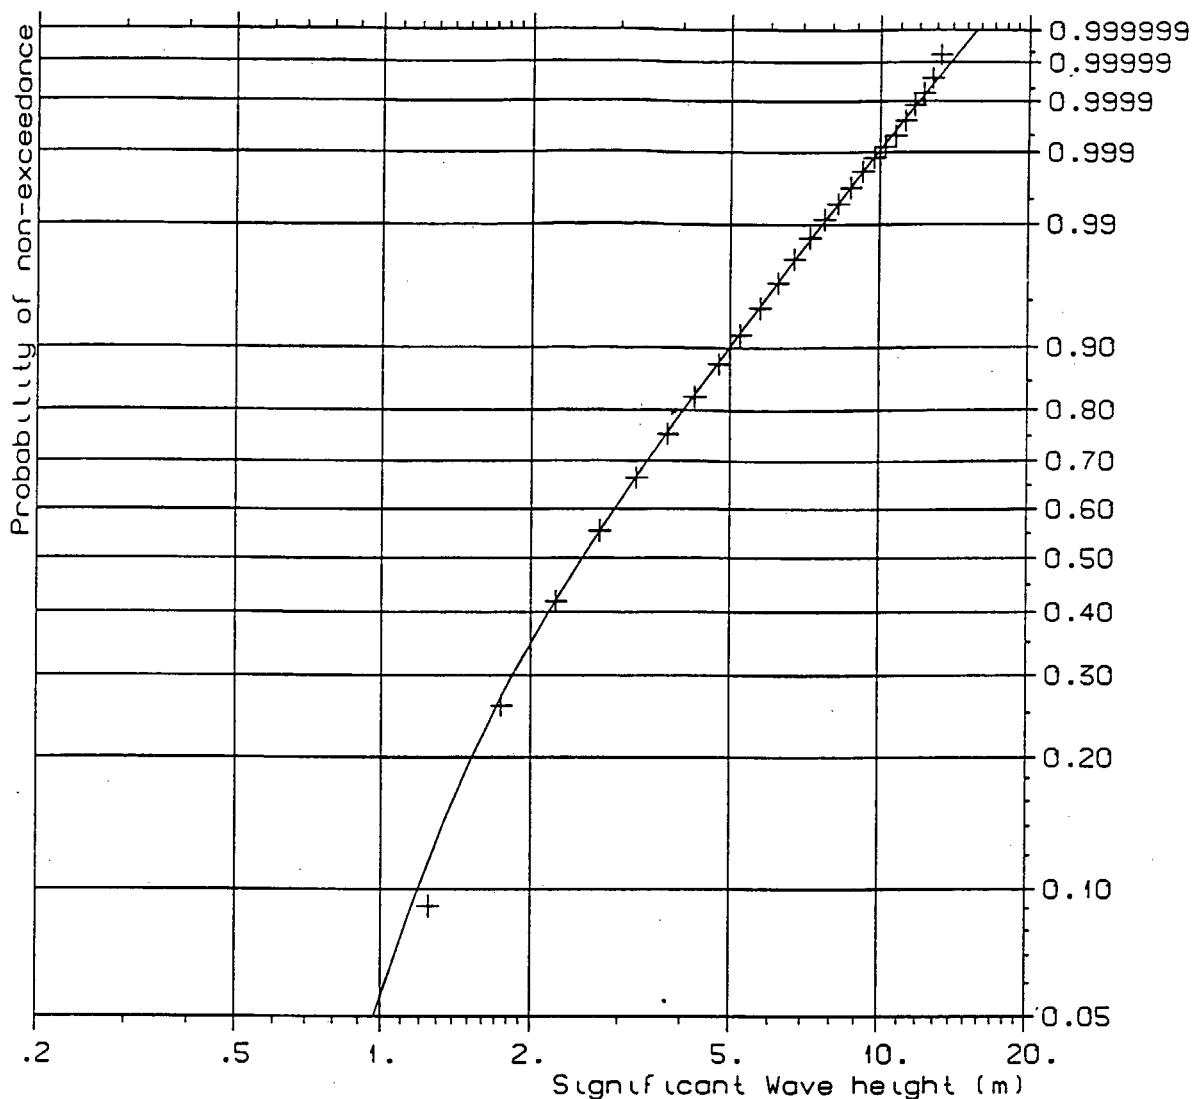

GENERAL INFORMATION:

No. of data : 123590
 No. of indep. data: 3433

STATFJORD A/GULFAKS C 1981-1996
 Wind speed measured in top of
 derrick reduced to 10 m a.m.s.l.

FIGURE
 5.1

5.2 10-100 year estimates of significant wave height based on data from buoy located at Statfjord A (until dec 1991) and MIROS wave radar on Gullfaks C

**MODEL DISTRIBUTION:**

WEIBULL parameters:

Shape	1.441
Scale	2.424
Location	0.659

Estimated using:

Method of Moments

ESTIMATED EXTREMES:

"RETURN" PERIOD - years -	VALUE - m -
1.0	10.9
5.0	12.3
25.	13.6
100.	14.7

Duration of exceedance:

3.0 hours

OBSERVED DISTRIBUTION:

Mean value	2.86
Std. deviation	1.55
Skewness	1.14

GENERAL INFORMATION:

No. of data	:	93379
No. of indep. data:		2594

FIGURE**5.2**
